1. Introduction

This Project is based on Personal Expense Tracker is a web application developed to help users manage their personal finances efficiently. The system enables users to record income and expenses, categorize transactions, set monthly budgets, and analyse their spending habits.

2. Problem Statement

Managing personal finances manually or using basic applications often leads to poor organization of financial records and limited insights into spending habits. Traditional monolithic systems become difficult to maintain and scale as additional features are introduced.

There is a need for a modular expense management system where different functionalities operate independently while maintaining seamless communication.

3. Objectives

The primary objectives of this project are:

- Develop a web-based expense tracking application using different languages.
- Allow users to record and manage daily income and expenses.
- Categorize financial transactions.

- Enable users to create monthly budgets.
- Generate monthly financial summaries and reports.
- Ensure a normalized database with minimal redundancy.
- Build a scalable and maintainable application.

4. Scope

The project includes the following modules:

- User Registration and Authentication
- Expense Management
- Category Management
- Budget Management
- Monthly Reports and Analytics

The application is intended for individual users and focuses on personal financial management.

5. Technologies Used

Component	Technology
Frontend	HTML5, CSS3, JavaScript, ReactJS (Optional)
Backend	Node.js
Database	MySQL
API Communication	REST APIs
Version Control	Git & GitHub
API Testing	Postman
Containerization	Docker

6. Expected Outcome

The proposed system is expected to:

- Provide a secure and user-friendly expense tracking platform.
- Maintain independent microservices with separate databases.
- Enable efficient management of expenses, categories, and budgets.
- Generate monthly financial reports and summaries.
- Demonstrate scalable and maintainable system architecture.
- Reduce data redundancy through proper normalization.
